## Wylfa Head Management

**Arfordir Mynydd y Wylfa – Trwyn Penrhyn Wildlife Site is located to the north of the proposed Wylfa Newydd development area.**

This site is made up of a mix of diverse coastal grassland, scrub, heath and maritime cliff habitats which support a variety of notable species, including breeding chough. Encroachment of coarse grassland, bracken and scrub in recent years has reduced the amount of suitable chough foraging habitat in recent years, but in spring 2018 Horizon commenced management works aimed at restoring habitat quality and boosting resilience of the chough population as well as other species supported by the site.
